2024 Cost of Production

# Hay: Round Bale and Silage

Guidelines For Estimating  
**Hay Production Costs - 2024**  
Round Bale Hay and Silage

**Date: January, 2024**

**\*\*revised 2024 MASC data\*\***

This guide is designed to provide planning information and a format for calculating the costs of producing a forage crop of 100% alfalfa or alfalfa grass mixture for the purpose of feeding livestock or export in Manitoba. General Manitoba Agriculture recommendations are assumed in using fertilizers and chemical inputs. These figures provide an economic evaluation of the crops and estimated yields required to cover all costs. Costs include labour, investment and depreciation, but do not include management costs, nor do they necessarily represent the average cost of production in Manitoba.

The assumptions on which the costs were calculated are clearly defined in the supporting pages. They were developed using a combination of recommended practices and methods followed by many producers.

These budgets may be adjusted by putting in your own figures. As a producer, you are encouraged to calculate your own costs of production for your alfalfa hay crops. On each farm, costs and yields differ due to soil type, climate and agronomic practices.

This tool is available as an Excel worksheet at:

[The Farm Machinery Custom and Rental Rate Guide](#) is also available to help determine machinery costs.

The fertilizer recommendation will vary depending on the soil type, climate and crop rotation. Manitoba Agriculture recommends that soil test sampling and analysis be conducted each year to produce a better baseline for fertility. On many Manitoba soil types, potash application can be reduced based on soil test results. Custom soil sampling and analysis typically costs \$1.00 to \$2.00/acre.

1. Users are reminded to adjust silage yields when making changes to fertilizer rates.

## Other Assumptions

### **Fuel Costs:**

Includes fuel used for field work, and trucking in inputs.

### **Machinery Operating Costs:**

Includes costs for maintenance, repairs, licenses and insurance.

### **Crop Insurance: (2023 rates)**

Forage Region 6 - Establishment Insurance at \$80/ac coverage and annual Select\_Hay insurance at 80% coverage. Risk Area 15 - Greenfeed Insurance at 80% coverage.

### **Other Costs:**

Includes overhead expenses: hydro, telephone, accounting, buildings, supplies and insurance, etc.

### **Bale Moisture:**

Bale moisture based on: 12.1% alfalfa hay; 12.6% alfalfa-grass hay; 14.2% greenfeed hay; 50% alfalfa baled silage; 50% alfalfa-grass baled silage and 50% greenfeed baled silage.

### **Land Taxes:**

The average for the province was based on land tax assessment and mill rates of a sample of municipalities growing crops less provincial tax rebate.

### **Interest On Operating:**

Interest charges on operating costs are calculated at 9% for six months.

### **Land Cost:**

Based on approximate average land values. Budget assumed 15% financed at 8% for 25 years, plus 1.5% land equity opportunity cost. Budget can be used to estimate cashflow by removing investment cost.

P&I Cost (based on \$270,000 Mortgage) = \$25,293 payments per year / 600 acres = \$42.16/acre)

Investment = (Total Investment x Owned Equity %) x Investment Rate % (eg. ((\$3,000 x 85%) x 1.5%) = \$38.25/acre)

### **Machinery Cost:**

Based on approximate average machinery values. Budget assumed 45% financed at 8.5% for 7 years, depreciation costs over 15 years with a 25% residual value, plus 1.5% machinery equity opportunity cost. Budget can be used to estimate cashflow by removing depreciation and investment cost.

P&I Cost (based on \$102,465 + \$18,000 Loan) = \$20,019 + \$3,517 payment per year / 600 + 300 acres = \$33.36 + \$11.72/acre)

Depreciation (Useage Cost) = (Total Investment - Residual Value) / Years Useful Life (eg. (\$379.50 - (\$379.50 x 25%)) / 15 = \$18.98/acre)

Investment = (Total Investment x Owned Equity %) x Investment Rate % (eg. (\$379.50 x 55%) x 1.5%) = \$3.13/acre)

### **Estimated Farmgate Values:**

Forage prices are based on estimated prices for fall/winter 2023/24.

### **Storage Cost:**

Dry hay storage costs are estimated at \$0.00 per acre.

### **Profitability & Breakeven Analysis:**

Gross Revenue = Price per unit x Yield per acre (eg. alfalfa: \$160.00/ton x 3.5 ton/ac = \$560.00/ac)

Net Profit = Gross Revenue - Total Cost

(eg. alfalfa: \$560.00 gross revenue - \$418.33 total cost = \$141.67 per acre)

Operating Expense Ratio = (Operating Cost / Gross Revenue) x 100

(eg. alfalfa: \$250.05 operating expense / \$560.00 gross revenue = 44.7%)

Breakeven Price = Cost / Target Yield (eg. alfalfa cost \$418.33 / 3.5 ton = \$119.52 per ton)

Breakeven Yield = Cost / Price per Unit (eg. alfalfa cost \$418.33 / \$160.00 ton = 2.61 ton)

**January, 2024**
